Marking Scheme for COMPSCI4011 - Operating Systems (H), Assessed Coursework – Disk Driver

Your submission will be marked on an 100 point scale. Substantial emphasis is placed upon **WORKING** submissions, and you will note that a large fraction of the points is reserved for this aspect. It is to your advantage to ensure that whatever you submit compiles, links, and runs correctly.

You must be sure that your code works correctly on the Ubuntu virtual machine (VM) provided on moodle, regardless of which platform you use for development and testing. This VM will be used for marking. Leave enough time in your development to fully test on the VM before submission.

Design – 30 Marks

- design diagram showing dataflows and interactions in your system (16)
- appropriate sizing of bounded buffers/other data structures (7)
- explanation of blocking behaviour matching the requirements (7)

Implementation – 70 Marks

- honest statement of the state of the solution (10)
- ***workable*** implementation (30)
    - An implementation is considered workable when it appropriately and efficiently handles the concurrent interactions with the disk. This is based on the code.
- ***working*** implementation (30)
    - An implementation is considered to work when it compiles and links without warning and executes according to the specification of the assessment without memory leaks or deadlock.
    - Your code will be compiled based on the `Makefile` provided initially. Do not change it or your code will not compile and not run when marking, meaning it is not a working implementation.
